

Installation plan Washing machine

PWM 506 MOPSTAR 60 PWM 508 MOPSTAR 80

To avoid the risk of accidents or damage to the machine, it is **essential** to read operating and installation instructions before installation and commissioning. This prevents both personal injury and damage to the machine.

Installation and planning notes

Installation requirements

Electrical connection should only be made to a power supply provided in accordance with all appropriate local and national legislation and regulations.

In addition, all regulations issued by the appropriate utilities as well as standards relating to occupational safety, and all applicable valid regulations and technical standards must be observed!

Transportation and site access

The washing machine must not be moved without the transit bars in place. Keep the transit bars in a safe place. They must be re-fitted if the machine is to be moved again (e.g. when relocating the machine).

General operating conditions

Ambient temperature in installation room: +2 °C to +35 °C.

Depending on the nature of the installation site, sound emissions and vibration may occur. Miele recommends consulting a specialist if particular requirements apply at the installation site with respect to sound emissions.

Electrical connection

Depending on the model, the machine is delivered with a supply lead with/without a plug.

The appliance may only be connected to an electrical system that conforms to the national and local codes and regulations (BS 7671 in the UK). The installation must be performed by a gualified electrician.

The data plate indicates the nominal power consumption and the appropriate fuse rating. Compare the specifications on the data plate with those of the electrical power supply.

It is always recommended to make electrical connection via a plug and socket so that electrical safety checks, e.g. during repair or service work, can be carried out easily.

The machine can be hard-wired or connected using a switched connection in accordance with IEC 60309-1. If the machine is hard wired, a dual circuit breaker must be provided on-site. When switched off there must be an all-pole contact gap of at least 3 mm in the isolator switch (including circuit breaker, switch, fuses and relays according to IEC/EN 60947).

The plug connector or isolator switch should be easily accessible at all times. If the machine is disconnected from the electricity supply, the isolator must be lockable or the point of disconnection must be monitored at all times.

New connections, modifications to the system or servicing of the ground conductor, including determining the correct fuse amperage, must be carried out by a qualified electrician, as they are familiar with the pertinent regulations and the specific requirements of the electric utility company.

If converting the appliance to an alternative voltage, observe the instructions in the wiring diagram. Conversion must be performed by the Miele Customer Service Department or by an authorised service technician. The heater rating must also be adapted.

The washing machine should be connected directly to an electrical supply outlet. The use of extension leads to power the washing machine is not permitted and must not be used.

References to cable cross-sections in the technical data refer only to the required supply lead. Please consult relevant local and national regulations when calculating any other wire gauges.

For installation in GB

Both the hot and cold water hose must be connected to the mains water supply with the use of the provided double check valves.

Cold water connection

The washing machine should be connected to a mains water supply in accordance with current local and national safety regulations. The German authorities do not require it to have a non-return valve as the washing machine has been designed to comply with current local and national regulations on water safety.

Connection to the water supply should be carried out by a qualified plumber using a stopcock with a threaded union. If a stopcock is not available, a qualified plumber should connect the machine to the water supply.

A suitable connection hose with a threaded union is provided with the appliance.

Longer hoses (2.5 or 4.0 m in length) are available from your Miele dealer or the Miele Customer Service Department as separate items.

Hot water connection

The same connection requirements as for cold water also apply to hot water (max. 60 $^{\circ}\text{C}\text{)}.$

A suitable connection hose with a threaded union is provided with the appliance.

The hot water connection appliance also requires a cold water connection.

In the event that hot water is not available on site, connection of the second hose must be made to a cold water supply.

Alternatively, the hot water connection should be blocked using the enclosed blind stopper and the machine controls set to cold water intake.

The required amount of hot water should be added to the cold water volume.

Drain valve (depending on model)

The machine is drained using a motorised drain valve. The machine can be connected directly to the on-site drainage system (without a siphon) or via a floor drain (gully with odour trap).

A vented drainage system is vital for unimpeded drainage. If on-site venting is insufficient, a vent kit (Mat. no. 05 239 540) is available from your Miele dealer or the Miele Customer Service Department.

If several machines are connected to a single drain pipe, this should be sufficiently large to allow all machines to drain simultaneously.

Drain pump (depending on model)

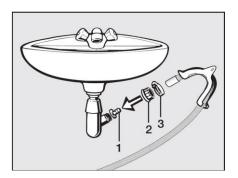

The suds are drained through a drain pump with a 1 m delivery head. For the water to drain freely, the hose must be free of kinks.

Drainage options:

- 1. Connected securely to a plastic drain pipe with a rubber sleeve. There is no need for a siphon.
- 2. Connected securely to a washbasin with a plastic nipple.
- 3. Connected securely to a floor drain (gully).

Securely connect the drain hose to a sink drain outlet

The drain hose can be connected securely to a suitable sink drain outlet.

If required, the hose can be extended to a length of up to 5 m. Accessories are available from the Miele Customer Service Department or from your Miele dealer.

For a delivery head of more than 1 m (up to a max. of 1.6 m), a replacement drain pump is available from the Miele Customer Service Department or from your Miele dealer.

Equipotential bonding

If necessary, equipotential bonding with good galvanic contact must be guaranteed in compliance with all applicable local and national installation specifications.

Connection material for equipotential bonding must be provided on site or using a kit available from the Miele Customer Service Department.

Peak load / energy management

The appliance can be connected to a peak-load or energy management system using an optional kit.

When the peak-load function is activated, the heating is deactivated. An appropriate message appears in the display.

Liquid dispensing connection

External liquid dispenser pumps with a "container empty" indicator can be used to dispense liquid detergents.

The dispenser pumps can only be programmed with MDU.

It is particularly important to observe manufacturer's instructions when using a combination of detergents, additives and special-purpose products.

Interface

The appliance can be fitted with an XKM 3200 WL PLT communication module.

This module can be used as a WiFi or LAN interface.

The LAN interface provided via the module complies with SELV (Safety Extra Low Voltage) in accordance with EN 60950. Connected

appliances must also comply with SELV. The LAN connection uses a RJ45 connector in accordance with EIA/TIA 568-B.

Installation

The machine must be installed on a perfectly smooth, level and firm surface which is able to withstand the quoted loads.

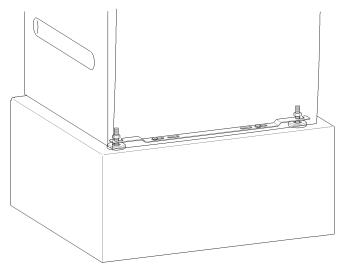

The floor load created by the machine is concentrated and transferred to the installation footprint via the machine feet.

The machine should be levelled in both directions with the aid of the adjustable feet.**Plinth installation**

The washing machine can be installed on a machine plinth (open or box plinth, available as an optional Miele accessory) or on a concrete plinth to be provided on site.

The quality of the concrete and its strength must be assessed according to the machine load. Ensure that any raised concrete plinth is adequately bonded to the concrete floor below!

If the washing machine is installed on a concrete or masonry plinth, it must be secured using the anchors supplied with the machine. Otherwise, there is the danger of the washing machine moving about during spinning and falling off a plinth.

The anchors provided can be used to bolt the machine to the floor by both front feet. The material provided is intended for use in bolting the machine to a concrete floor.

Bolts and fasteners for all other floor types must be provided on site.

Washer-dryer stack

The washing machine can be installed as a washer-dryer stack together with a Miele tumble dryer. A stacking kit (optional accessory) is required for this.

Installation of the stacking kit must be performed by the Miele Customer Service Department or an authorised Miele service technician.
